High-Performance Visual Closed-Loop Robot Control

Full text available as:
PDF - Requires Adobe Acrobat Reader or other PDF viewer.

Abstract

This thesis addresses the use of monocular eye-in-hand machine vision to control the position of a robot manipulator for dynamically challenging tasks. Such tasks are defined as those where the robot motion required approaches or exceeds the performance limits stated by the manufacturer.

Computer vision systems have been used for robot control for over two decades now, but have rarely been used for high-performance visual closed-loop control. This has largely been due to technological limitations in image processing, but since the mid-1980s advanced in image processing, but since the mid-1980s advances have made it feasible to apply computer vision techniques at a sufficiently high rate to guide a robot or close a feedback control loop. Visual servoing is the use of computer vision for closed-loop control of a robot manipulator, and has the potential to solve a number of problems that currently limit the potential of robots in industry and advanced applications.

This thesis introduces a distinction between visual kinematic and visual dynamic control. The former is well addressed in the literature and is concerned with how the manipulator should move in response to perceived visual features. The latter is concerned with dynamic effects due to the manipulator and machine vision sensor which limit performance and must be explicitly addressed in order to achieve high-performance control. This is the principle focus of the thesis.

In order to achieve high-performance it is necessary to have accurate models of the system to be controlled (the robot) and the sensor (the camera and vision system). Despite the long history of research in these areas individually, and combined in visual servoing, it is apparent that many issues have not been addressed in sufficient depth, and that much of the relevant information is spread through a very diverse literature. Another contribution of this thesis is to draw together this disparate information and present it in a systematic and consistent manner. This thesis also has a strong theme of experimentation. Experiments are used to develop realistic models which are used for controller synthesis, and these controllers are then verified experimentally.

Welcome to University of Melbourne ePrints Repository (UMER)

The University of Melbourne eprints Repository is an institutional server designed to load and provide free access to the research output of University of Melbourne academic staff.

The repository is part of a GO8 initiative here in Australia.

The initiative aims to:

- create an archive of the publications produced at individual institutions.
- enhance access and contribute to internationally linked scholarship
- increase awareness of and improve accessibility to Australian research and
- improve economics in scholarly communications

This GO8 initiative is part of a scheme to ensure that research output will be visible, accessible and usable through a global network of interlinked services. The initiative has established international standards for doing this and free software is now available for setting up institutional repositories which will be searchable by “scholarly” search engines such as Arc, myCai and OA1ster.

PHD and Masters Research Theses in this repository (UMER) are also available in the Australasian Digital Thesis (ADT)

More detailed information about UMER, including policies, instructions and copyright can be found at this page.
“Growing Esteem reaffirms Melbourne's intention to be one of the finest universities in the world, highly regarded for making distinctive contributions to society in research, learning and teaching and knowledge transfer.” (University of Melbourne, Office of the Vice-Chancellor 2007)

'Open Access' publishing will be strongly encouraged, including the establishment of institutional digital repositories of scholarly works. (University of Melbourne 2006)
The Information Services mission is to maximise our value by linking with the University of Melbourne’s Growing Esteem strategy and its triple helix through leadership, innovation and quality in information services, systems and technologies, namely, libraries; cultural collections and archives; e-learning services; e-research services; and corporate information management. (University of Melbourne, Information Services 2007)

Abstract

General A. H. Nasution established the Armed Forces History Centre in 1964 for the purpose of countering a communist history of the 1945-49 revolution. After the coup attempt of 1965 and the ensuing military takeover of government the History Centre assumed a far more assertive and prominent role in history making. The fact that Nuorohto Notsusanto, as Head of the Centre, took over the planning of Sukarno's half-completed National Monument History Museum project in 1969 provides evidence of the extent to which national history making became military business in the early New Order period. The study considers how history was represented in the projects of the Centre from its inception in 1964 to its last museum project in 1993. It traces how the military used history from the early years of the New Order to legitimize the overthrow of the Sukmo regime, to justify the killing of perhaps 500,000 alleged communists, to strengthen military unity and to legitimize the military’s political role and the suppression of regime dissent. Where possible this study compares military representations of the Indonesian past with earlier representations of the past, especially Sukarnoist interpretations of the past made in the leftist Guided Democracy period. In doing so the thesis examines how the national myth and related constructions of national identity were transformed by the military-dominated New Order regime.
