

THE GATE TO EUROPE'S KNOWLEDGE

The European Library: opportunities for new services

Theo van Veen, Koninklijke Bibliotheek

Overview

- Introduction
- Overview of architecture
- Services
- TEL metadata
- Collections
- TEL and LEAF: name authorities
- Conclusions

Introduction

- An “accompanying measure” created under auspices of CENL
- Collaboration of national libraries of Finland, Germany, Italy, Netherlands, Portugal, Slovenia, Switzerland, United Kingdom and ICCU and CENL
- Part funded by the European Commission for 30 months to test feasibility
- If successful it is anticipated that other CENL members will participate

What TEL is aiming at

- User perspective
 - integrated access with central index
 - multi-lingual subject terms and name authorities
 - links to local services
- Provider perspective
 - lower barrier to participate
 - simple protocols
 - facilitate conversions and addition of collections
- Library perspective
 - common vocabulary with ongoing development
 - machine readable metadata sharing

The work packages

- 1 Publisher relations
- 2 Business models
- 3 **Metadata**
- 4 **Interoperability testbeds**
- 5 Dissemination and use
- 6 Management

Potential TEL services

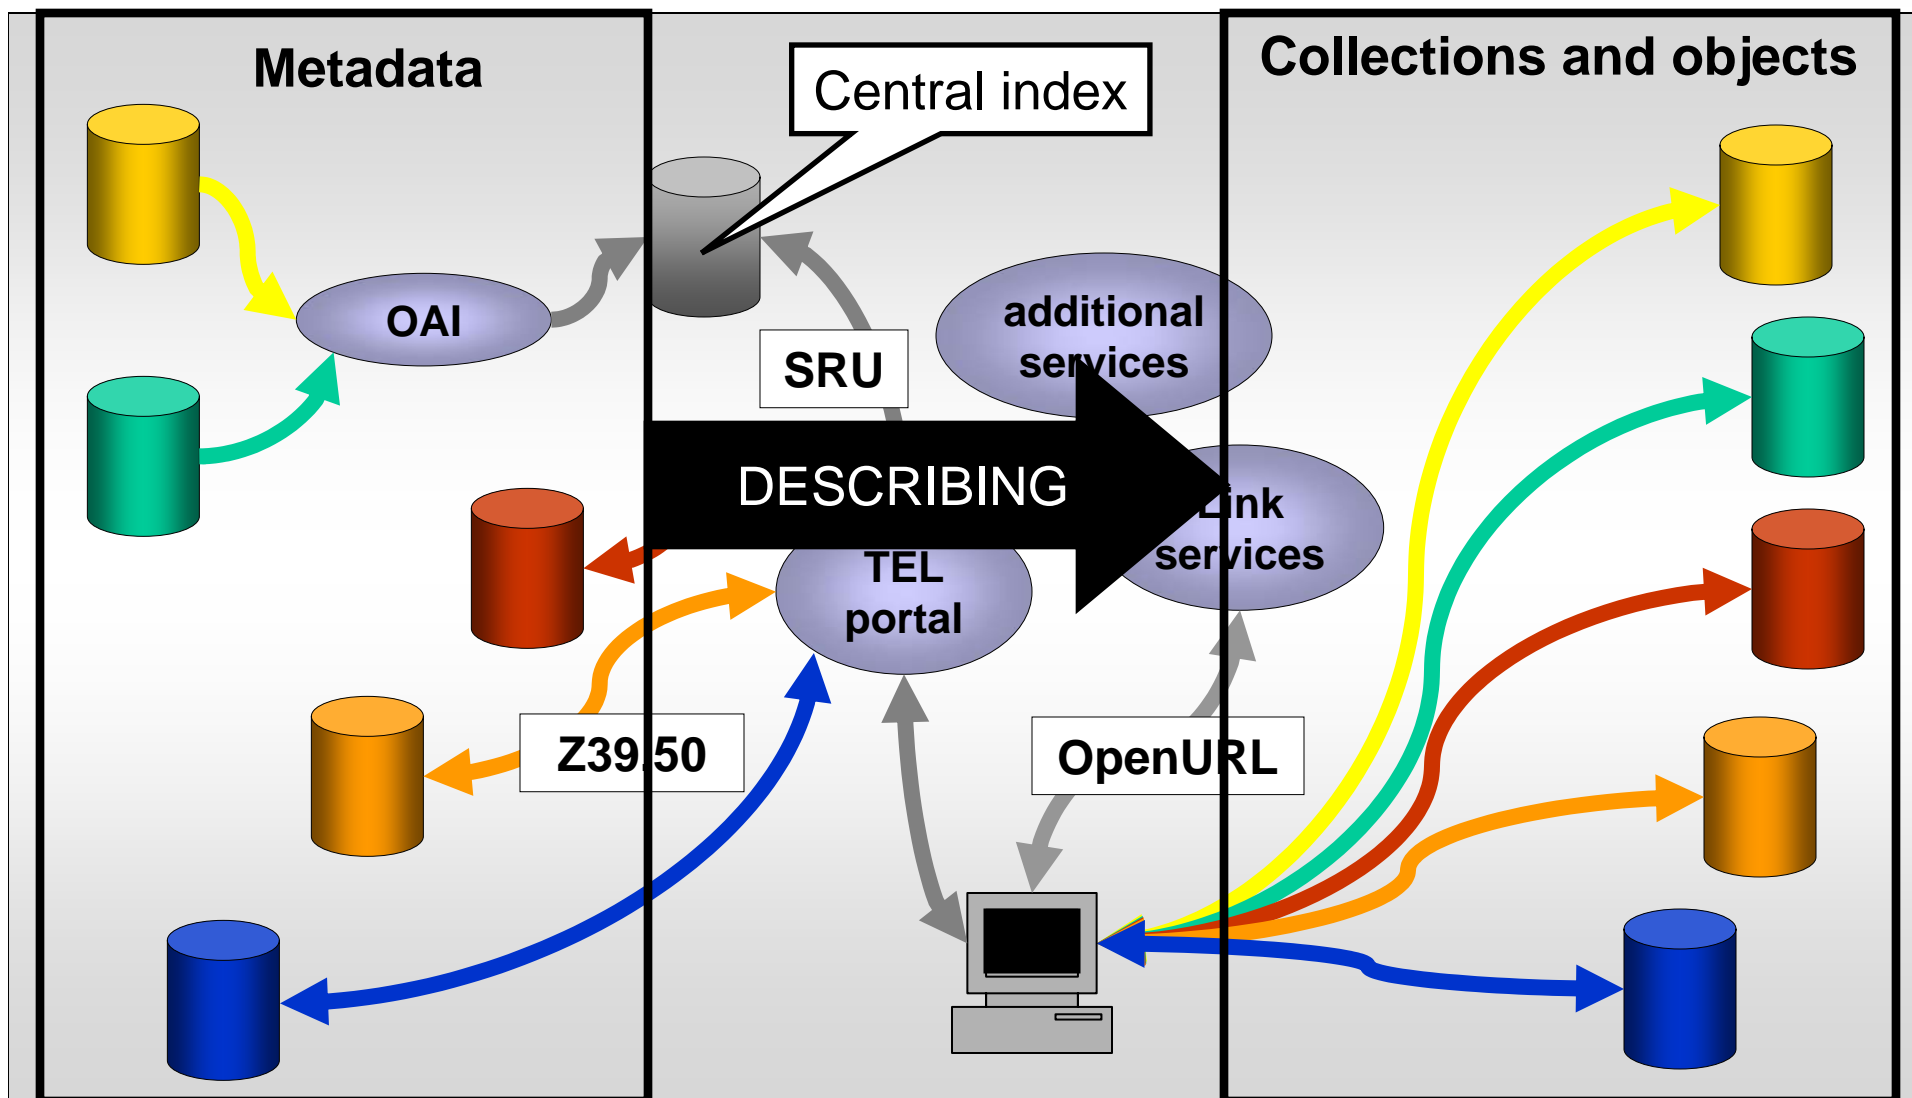

- Interlinking national resources
- Registry of all European heritage collections
- Memory of Europe
- Virtual Europe (e)
- Automated search, abstracts and publication
- Timelines and geographical traveling through heritage collections
- Name authority services (using LEAF)

Create TEL metadata infrastructure that makes it easy to add new services !

How to create the infrastructure?

- Finding the right balance between:
 - Central indexing of distributed metadata by OAI-harvesting
 - Distributed searching by SRU/Z39.50
 - Dynamic linking
- Understanding each others metadata to facilitate automated linking between services

TEL overview

Highlights

- Combination of distributed searching via Z39.50 and central indexing using:
 - The Open Archives Initiative protocol for metadata harvesting (**OAI-PMH**)
 - Search and Retrieve via URLs (**SRU**)
- Integration with **collection level descriptions**
- Metadata **registry** for controlled evolution of TEL application profile
- User and context specific link services (**OpenURL**, URN)
- Extra services: **multilingual** subject service (MACS project), **name authorities** service (LEAF project) and authentication

Search and Retrieve via URLs (SRU)

- Initiative from Z39.50 implementers group
- **Low barrier** implementation of server and client
- Search via **simple** standard URL syntax
- **Human readable** query language (CQL)
- XML response conform **standard** schema in **standard** XML envelope
- TEL test interface for SRU written as **XSL stylesheet** with some additional javascript giving it very powerful portal functionality
- Allows linking by **automatic** generated searches.

Search and Retrieve via URLs (SRU)

- Initiative from Z39.50 implementers group to offer a **base-URL** for Z39.50
- Search **base-URL** can be written as a simple HTML page with javascript and XSL.
- Response **schema**
- Example **URL**

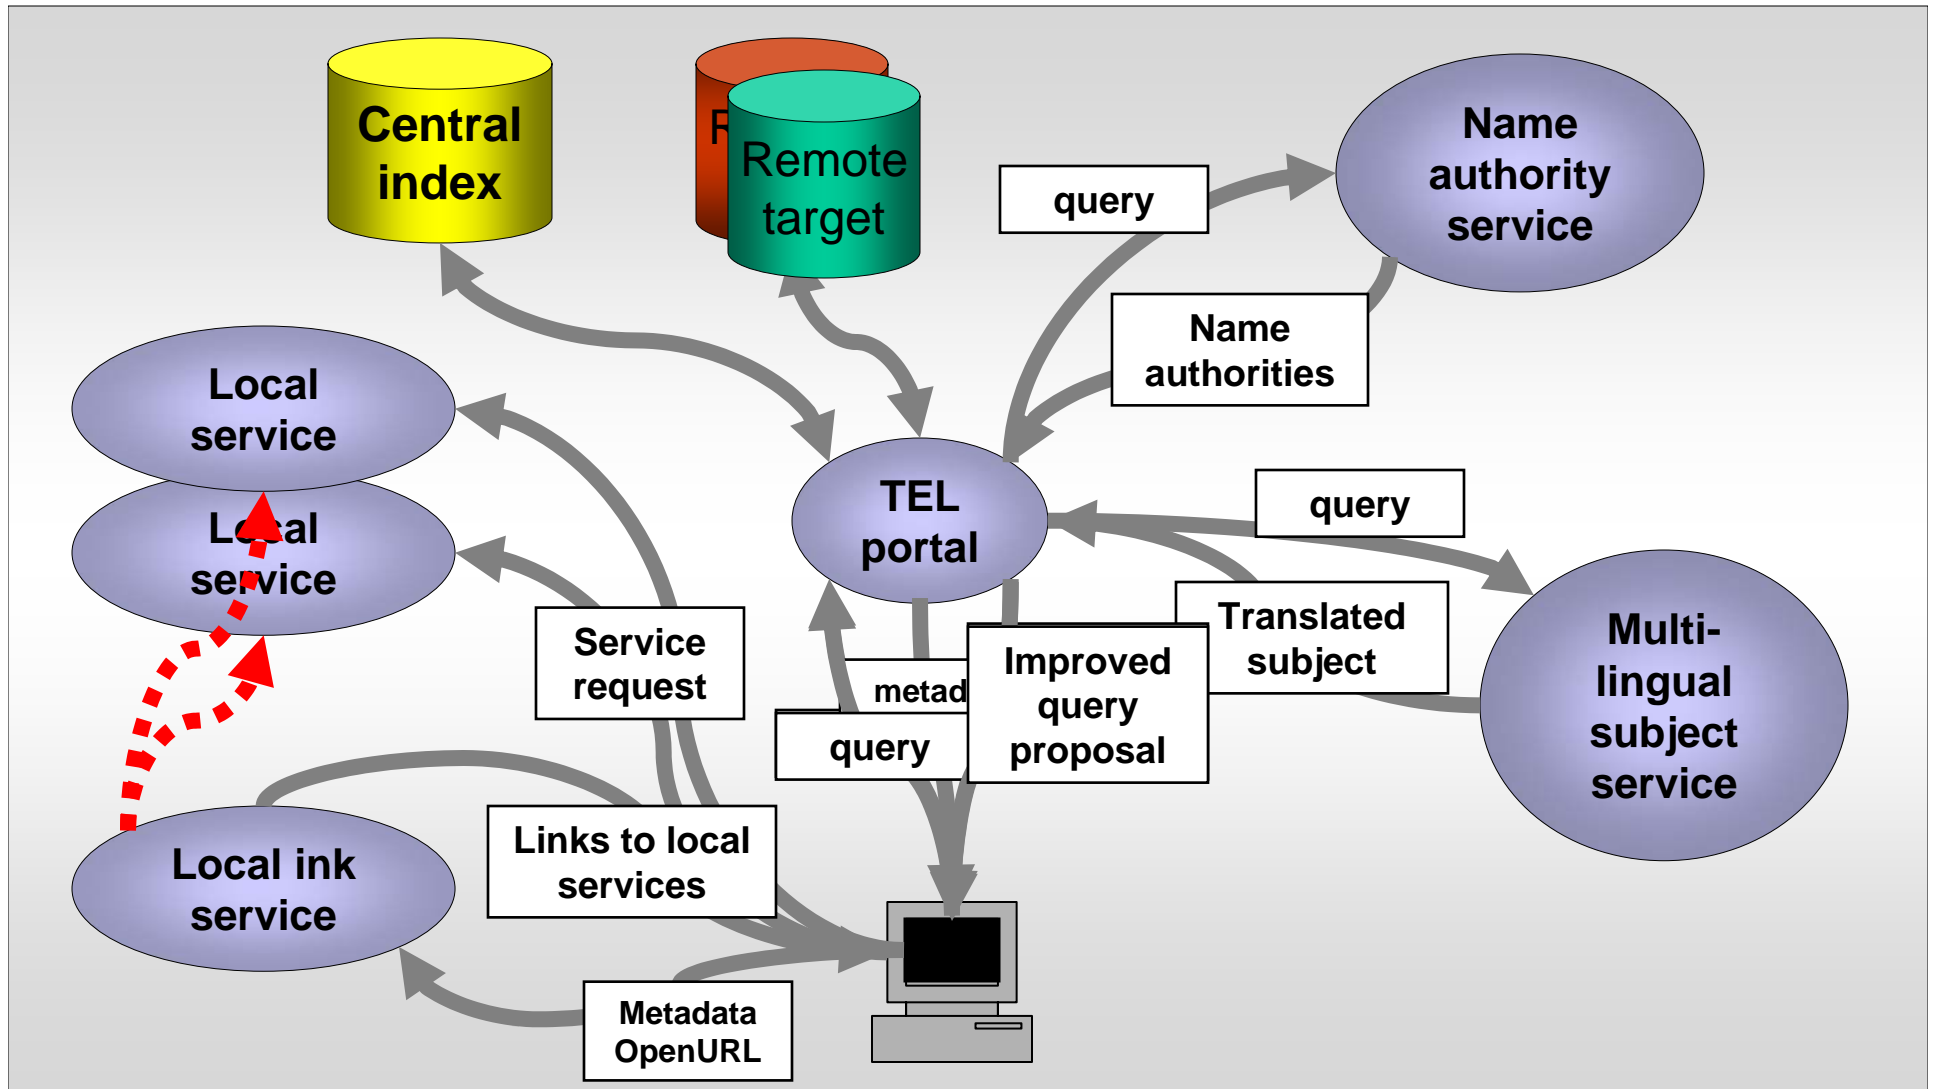

<http://krait.kb.nl/cgi-zoek/srw.pl?query=porbase&maximumRecords=1>

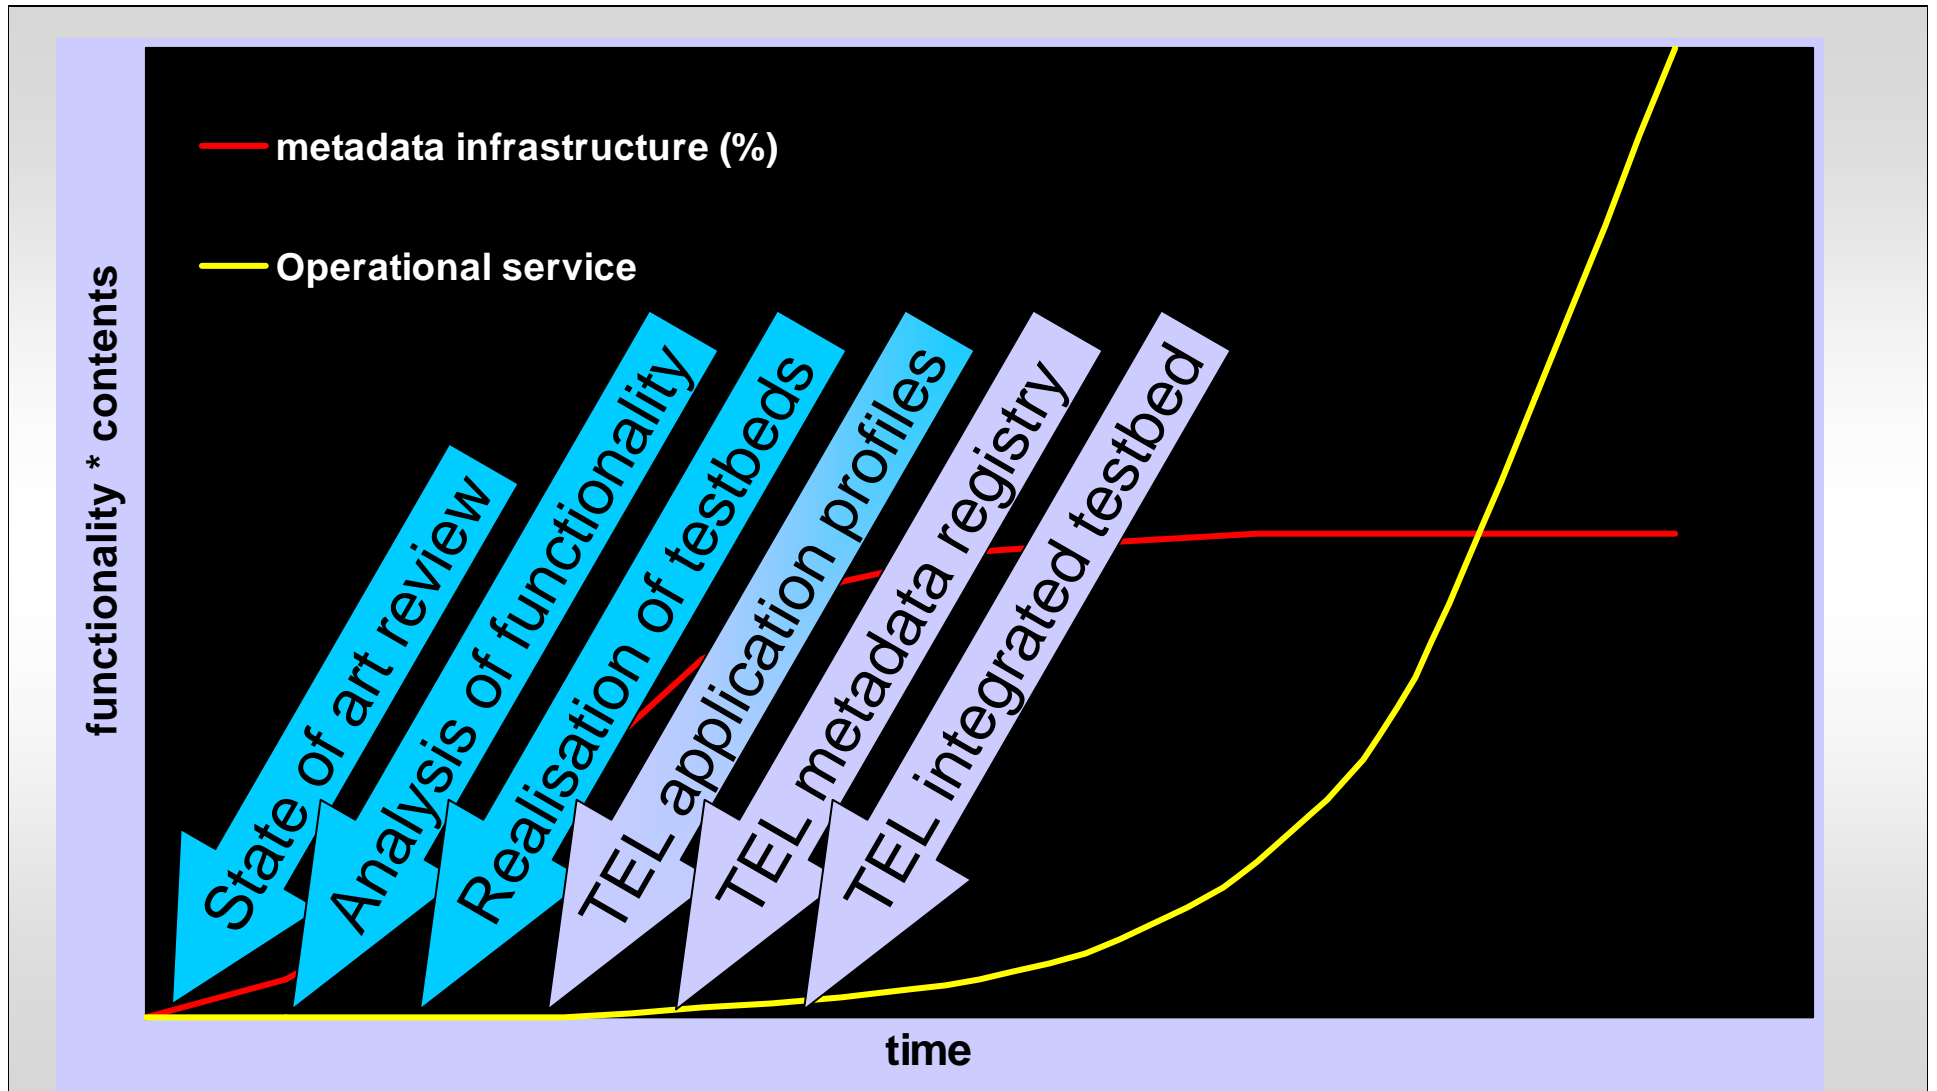

Central indexing - distributed searching

<u>Central indexing</u>	<u>Distributed search</u>
Uniform search options	Search options may differ per target
Predictable performance	Performance determined by slowest target
Easy integration of search results	More difficult to integrate of search results
Centrally controlled index	No control on distributed indexes
Less overall system load: one search is one request	System load is multiplied by number of requested systems

Metadata and TEL services

TEL realisation

Mapping metadata against functions

- List all metadata elements in DC-Lib
- List (all) possible functions
- Check for each combination whether metadata are usable, needed or not relevant
- Identify metadata elements that are missing or need special attention

DC-Lib elements	functions												Comment			
	Qualifier/ scheme/ Role	Search/resource discovery	Retrieval of metadata	Identification	Description	Link service	Multilinguality	Theaurus service	Collection level	Authorisation	Administration	Hard and softw.		Navigation	Copy cataloguing	Miscellaneous
id		X	X			X				X					X	Identifies the metadata record
base-URL		X	?			X		X					X		X	Encoding scheme for a URL with variable query
URN				X		X		X					X		X	Encoding scheme for URN's
URL				X		X		X					X		X	Encoding scheme for persistent URL's
openURL				X		X		X					X		X	Encoding scheme for queries with a variable base-URL
		X			X			X	X	X			X	?	?	

Functions and services

- search
 - record
 - identification
 - description
 - linking
 - multilingual service
 - authority service
- Identification of original record (harvesting, linking, reference)
- A TEL application profile allows harmonisation and common understanding of metadata to enable these functions.
- Description
- er
- ments
- copy cataloguing
 - document ordering

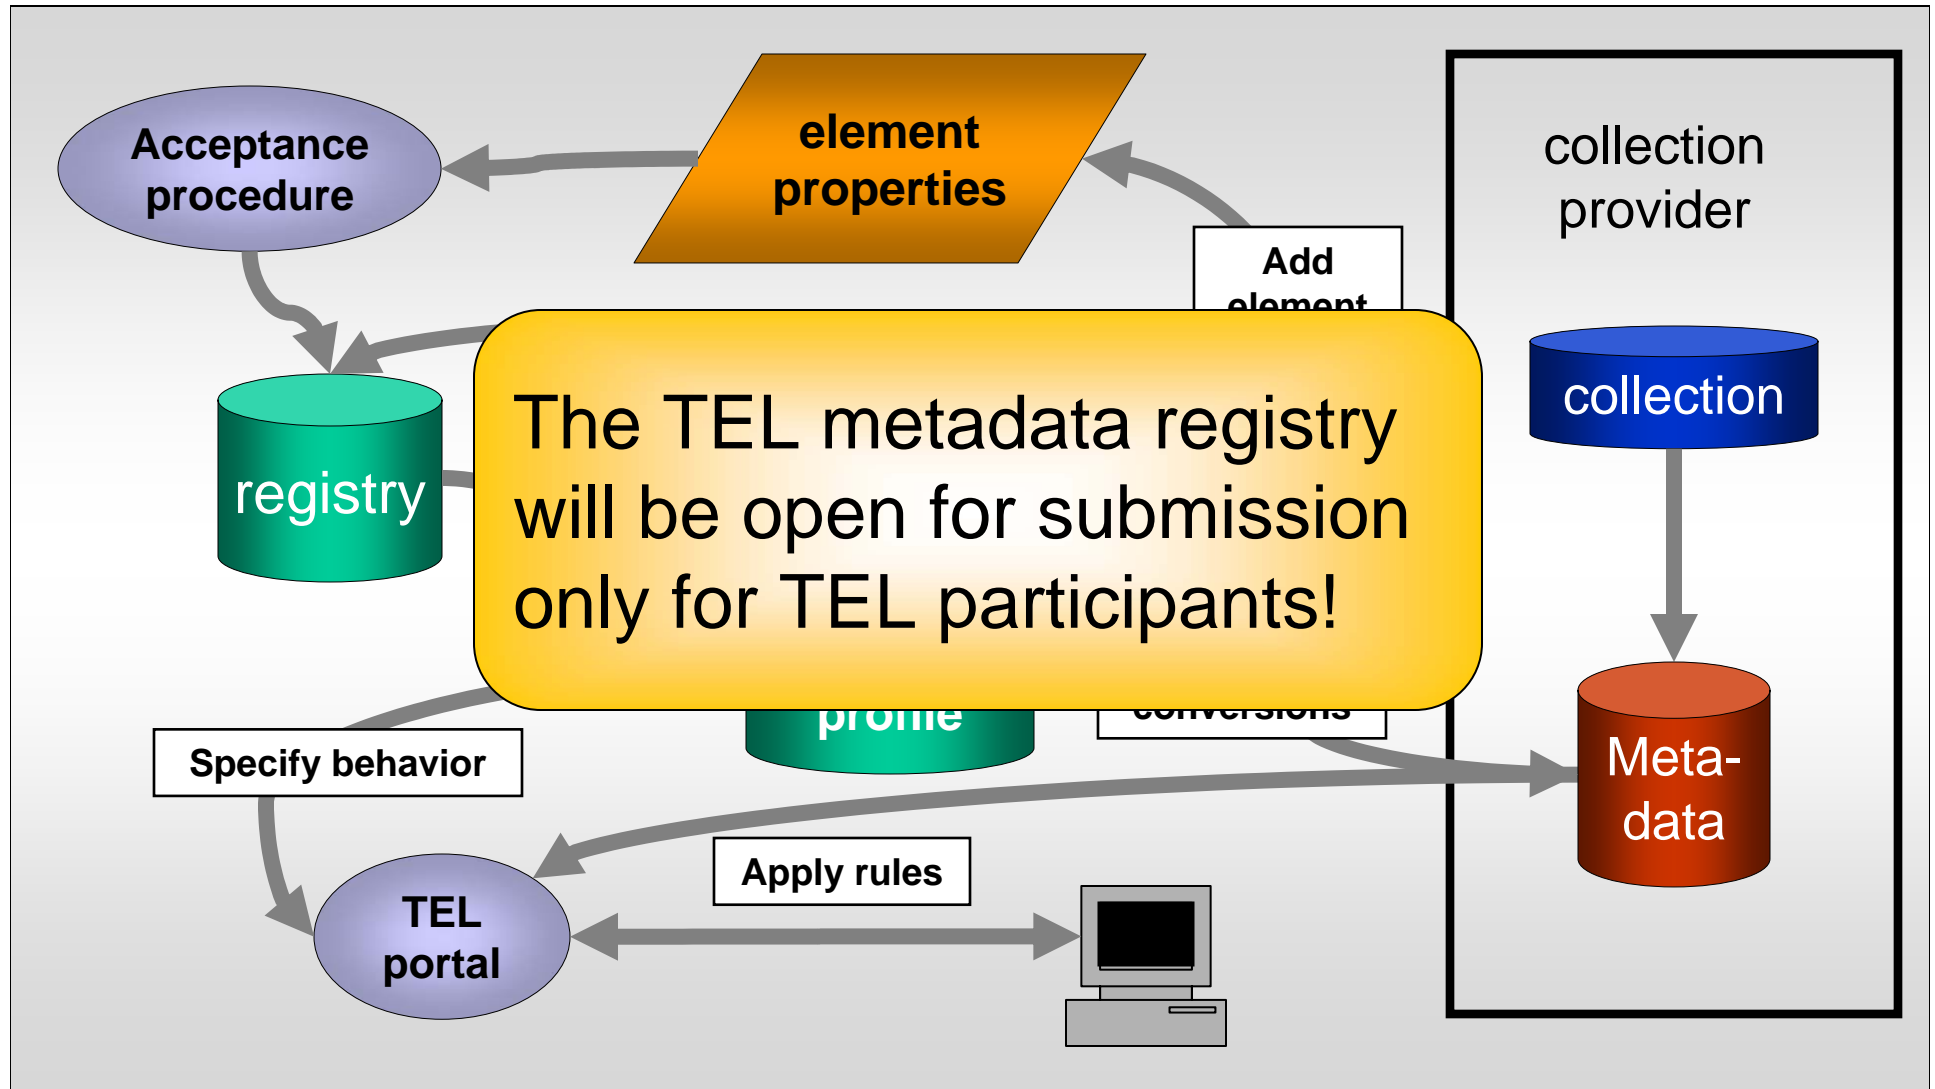

TEL application profile

- Specification of elements, definitions, rules, and namespaces
- Specifications of characteristics like:
 - T
 - V
- Elements and namespaces:
 - D
 - D
 - DC
 - DC-ED (DC Educational AP elements)
 - MODS (LC MODS)
 - Collection Level Description elements
 - TEL (TEL specific elements)

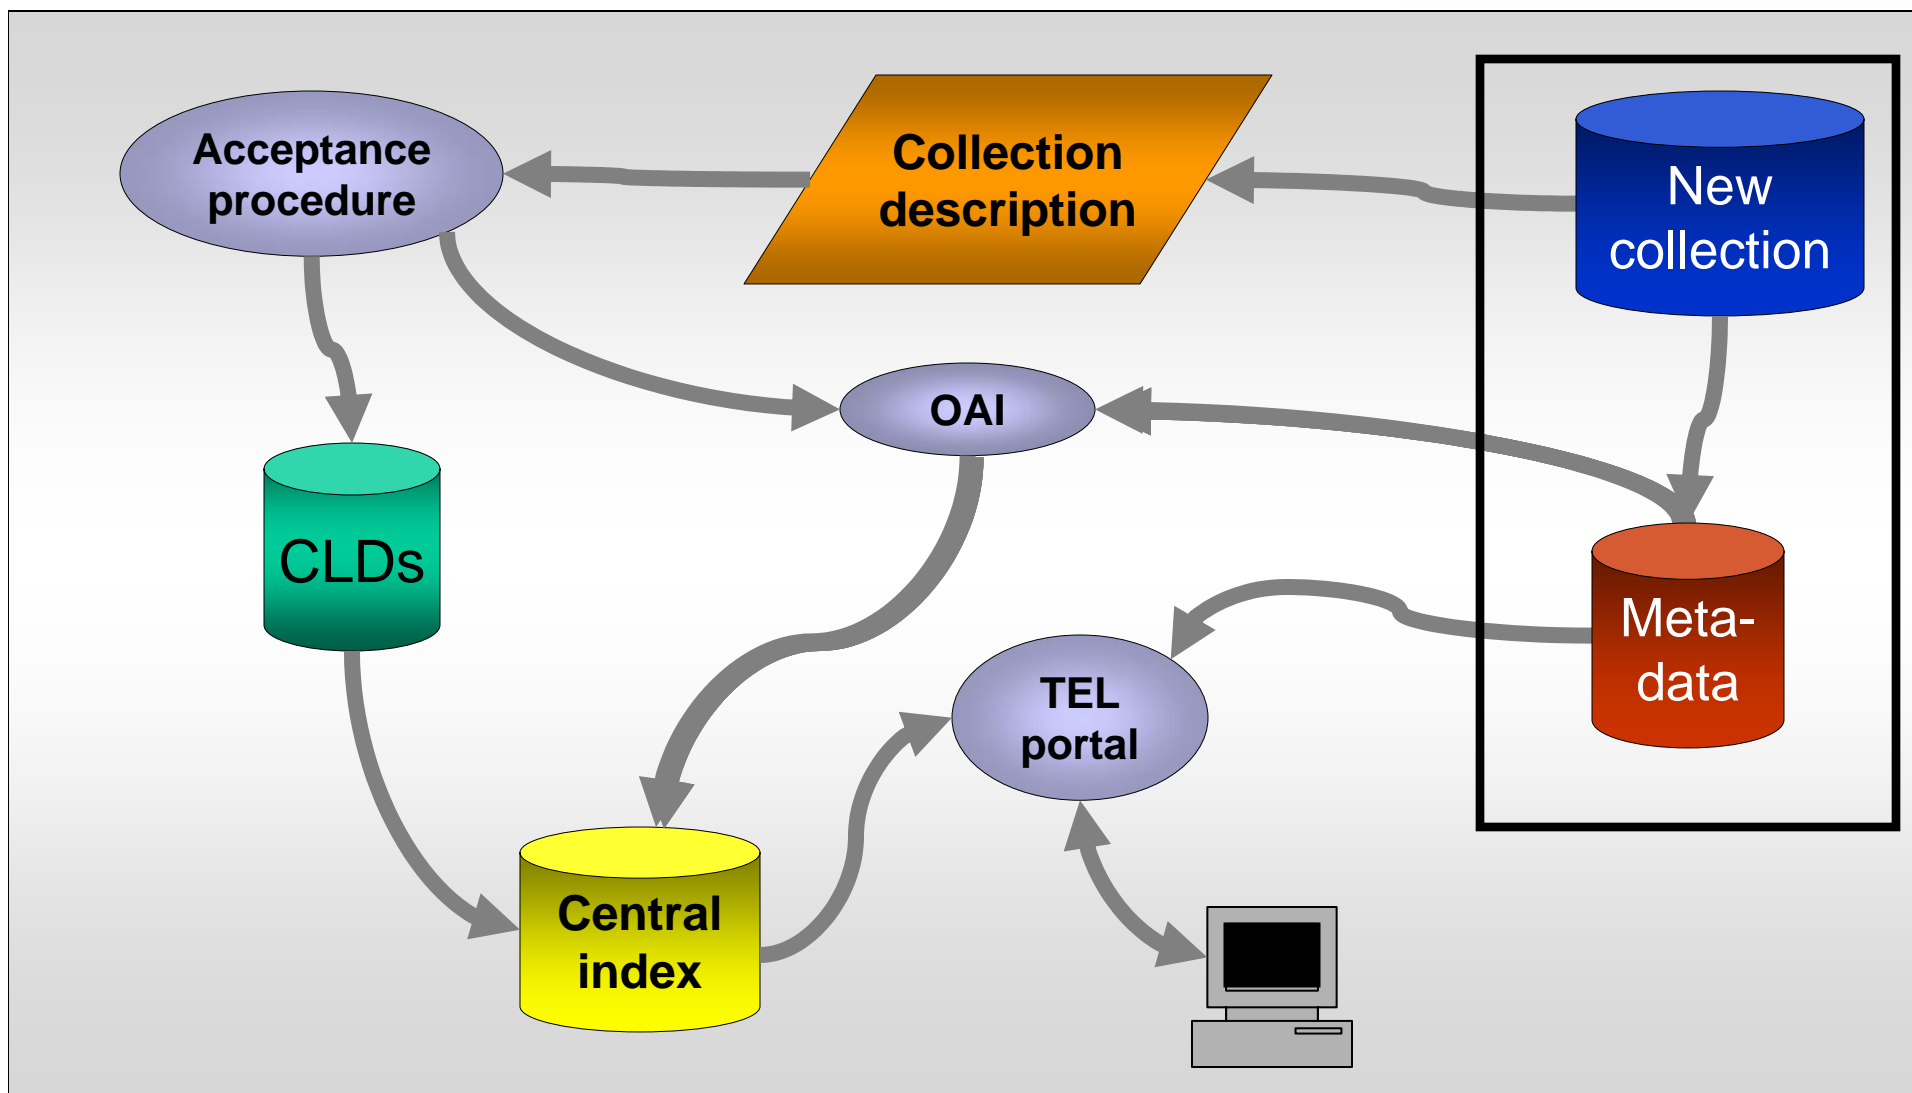

But we need a TEL Metadata Registry for the controlled evolution of the Application Profile!

demo

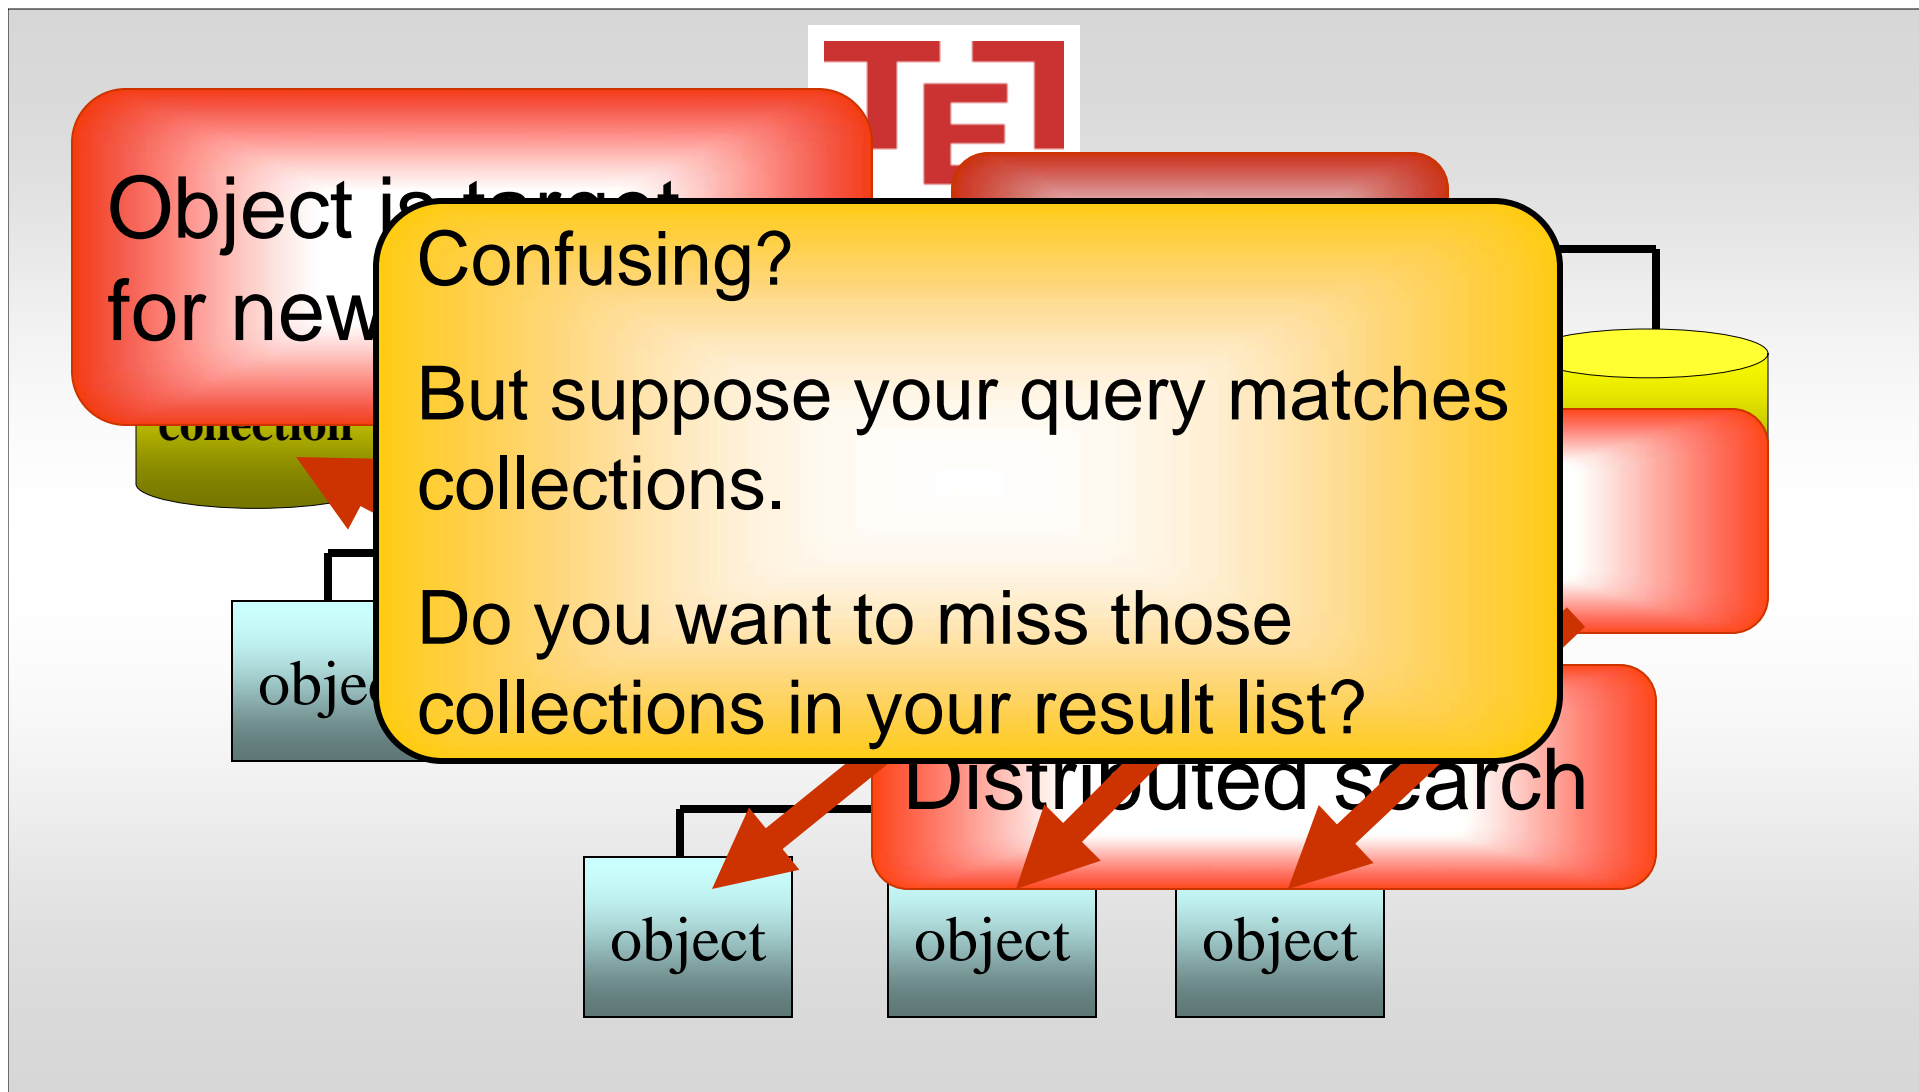

Usage of the registry/profile

Enter new collection

Collection hierarchy

Name authorities in TEL: Different scenenario's

1. Complete integration with bibliographic records in single index
2. Separate bibliographic and authority services (use on request only).
3. Linking by index terms (independent bibliographic and authority databases)
4. Linking by authority record-id (coupled bibliographic and authority databases)

1. Complete integration

<u>title</u>	<u>author</u>	<u>type</u>
xxxxxxxxxxxxx	Andrade	book
aaaaaaaaaaaa	Andrade	book
Link to authority record	Andrade	name authority
zzzzzzzzzzzz	Andrade	book

authorities

Single search in
single index

2. Separate bibliographic and authority databases

<u>Database</u>	<u>#hits</u>
TEL collections	0
Porbase	0
Other collections	0
LEAF authority database	1

Distributed search in more indexes

authorities?

3. Linking by index terms

- Index term authority – index

query generated from previous search result

New query proposal

	Name authority record
Main entry:	xxxxxxx (used for new search)
Pseudonym:	yyyyyyy (searched)

Original query

4. Linking by authority record-id

<u>Authority record</u>	<u>database</u>	<u>id</u>
Smith, J (1950-)	DB Y	DBA001
Smith, J (1950-)	DB Y	DBY001
Smith, J (1950-)	DB X	DBX123
Smith, J (1950-)	DB ZZZ	DBZ456
Smith, J (1946-)		DBY678

Metadata elements to be put in TEL application profile.

Link to original authorities by unique id.

Search results from LEAF in TEL?

4. Linking by authority record-id

- Need mutual knowledge on authorities
- Less duplication and more uniformity by sharing authorities
- Difficult to realise (different languages, organisations, formats etc.)
- Very powerful tool in multi-cultural and multi-lingual environment
- Useful in one central index: OAI-PMH harvesting of authority records

SRU test interface
SRU test interface
(work in progress)

Conclusions

- Although the current TEL project will not result in a fully operational European Library system, the results of the project will constitute the groundwork on which TEL's ambitious vision can be realised.
- TEL is following the newest open standards like Dublin Core in XML, Application Profiles, OAI, SRU and OpenURL.
- Integration of the TEL Application Profile, Search and Retrieve via URL's and OAI-PMH facilitates co-operation with other services as offered by LEAF.
